monsterlabstore.asia

289 <sup>0</sup>**92 pages returned 4XX status code**

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability.

This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it.

This usually happens due to the following reasons: 1.

DDoS protection system. 2. Overloaded or misconfigured server.

How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.

Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

92 <sup>0</sup>**92 internal links are broken**

About this issue: Broken internal links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken.

Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.

If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

92 <sup>0</sup>**78 issues with duplicate title tags**

About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned.

Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: <https://support.google.com/webmasters/answer/35624>.

78 <sup>0</sup>

### 24 pages have duplicate content issues

**24** 0

About this issue: Webpages are considered duplicates if their content is 85% identical. Having duplicate content may significantly affect your SEO performance. First of all, Google will typically show only one duplicate page, filtering other instances out of its index and search results, and this page may not be the one you want to rank. In some cases, search engines may consider duplicate pages as an attempt to manipulate search engine rankings and, as a result, your website may be downgraded or even banned from search results. Moreover, duplicate pages may dilute your link profile. How to fix. Here are a few ways to fix duplicate content issues: 1. Add a rel="canonical" link to one of your duplicate pages to inform search engines which page to show in search results. 2. Use a 301 redirect from a duplicate page to the original one. 3. Use a rel="next" and a rel="prev" link attribute to fix pagination duplicates. 4. Instruct GoogleBot to handle URL parameters differently using Google Search Console. 5. Provide some unique content on the webpage. For more information, please read these articles: <https://support.google.com/webmasters/answer/66359?hl=en> and <https://support.google.com/webmasters/answer/139066?hl=en>.

### 2 issues with mixed content

**2** 0

About this issue: If your website contains any elements that are not secured with HTTPS, this may lead to security issues. Moreover, browsers will warn users about loading unsecure content, and this may negatively affect user experience and reduce their confidence in your website. How to fix: Only embed HTTPS content on HTTPS pages. Replace all HTTP links with the new HTTPS versions. If there are any external links leading to a page that has no HTTPS version, remove those links.

### 1 page has slow load speed

**1** 0

About this issue: Page (HTML) load speed is one of the most important ranking factors. The quicker your page loads, the higher the rankings it can receive. Moreover, fast-loading pages positively affect user experience and may increase your conversion rates. Please note that "page load speed" usually refers to the amount of time it takes for a webpage to be fully rendered by a browser. However, crawler only measures the time it takes to load a webpage's HTML code - load times for images, JavaScript and CSS are not factored in. How to fix: The main factors that negatively affect your HTML page generation time are your server's performance and the density of your webpage's HTML code. So, try to clean up your webpage's HTML code. If the problem is with your web server, you should think about moving to a better hosting service with more resources.

0 pages returned 5XX status code

0 pages are missing the viewport width value	0

monsterlabstore.asia

**76920** 0**30423 issues with uncompressed JavaScript and CSS files**

About this issue: This issue is triggered if compression is not enabled in the HTTP response. Compressing JavaScript and CSS files significantly reduces their size as well as the overall size of your webpage, thus improving your page load time. Uncompressed JavaScript and CSS files make your page load slower, which negatively affects user experience and may worsen your search engine rankings.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, you should make sure they do not affect your page's load time. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Enable compression for your JavaScript and CSS files on your server.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, contact the website owner and ask them to enable compression on their server. If this issue doesn't affect your page load time, simply ignore it.

**30423** 0**30423 issues with uncached JavaScript and CSS files**

About this issue: This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time.

And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: If JavaScript and CSS files are hosted on your website, enable browser caching for them.

If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.

**30423** 0**12704 issues with unminified JavaScript and CSS files**

About this issue: Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>.

How to fix: Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.

**12704** 0

### 2101 outgoing internal links contain nofollow attribute

2101 

About this issue: The rel="nofollow" attribute is an element in an <a> tag that tells crawlers not to follow the link (e.g., "<a href='\"http://example.com/link\" rel='\"nofollow\">Nofollow link example</a>")."Nofollow" links don't pass any link juice to referred webpages. That's why it is not recommended that you use nofollow attributes in internal links. You should let link juice flow freely throughout your website.

Moreover, unintentional use of nofollow attributes may result in your webpage being ignored by search engine crawlers even if it contains a valuable content. How to fix: Make sure not to use nofollow attributes by mistake. Remove them from <a> tags, if necessary.

---

### 252 pages don't have meta descriptions

252 

About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these article: Create good titles and snippets in Search Results: <https://support.google.com/webmasters/answer/35624>. How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

---

### 252 pages have a JavaScript and CSS total size that is too large

252 

About this issue: This issue is triggered if the total transfer size of the JavaScript and CSS files used on your page exceeds 2 MB. The size of the JavaScript and CSS files used on a webpage is one of the important factors for a page's load time. Having lots of clunky JavaScript and CSS files make your webpage "heavier" in weight, thus increasing its load time.

This in turn leads to a poor user experience and lower search engine rankings. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Review your pages to make sure that they only contain necessary JavaScript and CSS files.

If all resources are important for your page, consider reducing their transfer size.

---

### 252 pages use too many JavaScript and CSS files

252 

About this issue: This issue is triggered if a webpage uses more than a hundred JavaScript and CSS files. Each time a visitor navigates to a webpage, their browser first starts loading supportive files, such as JavaScript and CSS. For each file used by your webpage, a browser will send a separate HTTP request.

Each request increases your page load time and affects its rendering, which has a direct impact on user experience, bounce rate and, ultimately, search engine rankings. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Review your pages to make sure that they only contain necessary JavaScript and CSS files.

If all resources are important for your page, we recommend that you combine them.

### 242 pages have low text-HTML ratio

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.

That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

242 

### 239 images don't have alt attributes

About this issue: Alt attributes within `<img>` tags are used by search engines to understand the contents of your images. If you neglect alt attributes, you may miss the chance to get a better placement in search results because alt attributes allow you to rank in image search results. Not using alt attributes also negatively affects the experience of visually impaired users and those who have disabled images in their browsers.

For more information, please see these articles: Using ALT attributes smartly:

<https://webmasters.googleblog.com/2007/12/using-alt-attributes-smartly.html> and Google Image Publishing Guidelines: <https://support.google.com/webmasters/answer/114016?hl=en>.

How to fix: Specify a relevant alternative attribute inside an `<img>` tag for each image on your website, e.g., "``".

239 

### 19 external images are broken

About this issue: A broken external image is an image that can't be displayed because it no longer exists or because its URL is misspelled. Having too many broken external images negatively affects user experience and may be a signal to search engines that your website is poorly coded or maintained. How to fix: To fix a broken external image, perform one of the following: 1.

If an image was deleted or damaged, replace it with a new one. 2. If an image is no longer needed, simply remove it from your page's code.

3. If an image moved to a different location and you know its new address, change its URL.

19 

### 8 pages don't have an h1 heading

About this issue: While less important than `<title>` tags, h1 headings still help define your page's topic for search engines and users. If an `<h1>` tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an `<h1>` tag breaks your page's heading hierarchy, which is not SEO friendly.

How to fix: Provide a concise, relevant h1 heading for each of your page.

8 

## 5 external links are broken

5 0

About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken.

Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.

If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

0 links on HTTPS pages lead to HTTP page

0 issues with blocked internal resources in robots.txt	0
0 link URLs are too long	0

monsterlabstore.asia

407 0**245 resources are formatted as page link**

About this issue: We detected that some links to resources are formatted with `<a href>` HTML element. An `<a>` tag with a href attribute is used to link to other webpages and must only contain a page URL. Search engines will crawl your site from page to page by following these HTML page links.

When following a page link that contains a resource, for example, an image, the returned page will not contain anything except an image. This may confuse search engines and will indicate that your site has poor architecture. How to fix: Review your links.

Replace `<a href>` links with tags necessary for specific resources. For example, if you'd like to add an image, use an `<img>` tag with an alt attribute describing the contents of your image.

245 0**71 pages have only one incoming internal link**

About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them.

How to fix: Add more incoming internal links to pages with important content.

71 0**47 orphaned pages in sitemaps**

About this issue: An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget.

If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally. How to fix: Review all orphaned pages in your sitemap.xml files and do either of the following: If a page is no longer needed, remove it; If a page has valuable content and brings traffic to your website, link to it from another page on your website; If a page serves a specific need and requires no internal linking, leave it as is.

47 0**15 URLs with a permanent redirect**

About this issue: Although using permanent redirects (a 301 or 308 redirect) is appropriate in many situations (for example, when you move a website to a new domain, redirect users from a deleted page to a new one, or handle duplicate content issues), we recommend that you keep them to a reasonable minimum. Every time you redirect one of your website's pages, it decreases your crawl budget, which may run out before search engines can crawl the page you want to be indexed. Moreover, too many permanent redirects can be confusing to users.

How to fix: Review all URLs with a permanent redirect. Change permanent redirects to a target page URL where possible.

15 0

**8 links to external pages or resources returned a 403 HTTP status code**

8 0

About this issue: This issue is triggered if a crawler gets a 403 code when trying to access an external webpage or resource via a link on your site. A 403 HTTP status code is returned if a user is not allowed to access the resource for some reason. In the case of crawlers, this usually means that a crawler is being blocked from accessing content at the server level.

How to fix: Check that the page is available to browsers and search engines. To do this, follow a link in your browser and check the Google Search Console data. 1.

If a page or resource is not available, contact the owner of the external website to restore deleted content or change the link on your page. 2. If a page is available but our bot is blocked from accessing it, you can ask the external website owner to unblock the page, so we can check all resources correctly.

You can also hide this issue from your list.

**5 pages have more than one H1 tag**

5 0

**4 outgoing external links contain nofollow attributes**

4 0

About this issue: A nofollow attribute is an element in an <a> tag that tells crawlers not to follow the link. "Nofollow" links don't pass any link juice or anchor texts to referred webpages. The unintentional use of nofollow attributes may have a negative impact on the crawling process and your rankings.

How to fix: Make sure you haven't used nofollow attributes by mistake. Remove them from <a> tags, if needed.

**3 pages are blocked from crawling**

3 0

**3 links on this page have no anchor text**

3 0

About this issue: This issue is triggered if a link (either external or internal) on your website has an empty or naked anchor (i.e., anchor that uses a raw URL), or anchor text only contains symbols. Although a missing anchor doesn't prevent users and crawlers from following a link, it makes it difficult to understand what the page you're linking to is about.

Also, Google considers anchor text when indexing a page.

So, a missing anchor represents a lost opportunity to optimize the performance of the linked-to page in search results. How to fix: Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about.

Also, use short but descriptive text. For more information, please see the "Use link wisely" section in Google's SEO Starter Guide

[https://support.google.com/webmasters/answer/7451184?](https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0)

[hl=en&ref\\_topic=9460495&authuser=0.](https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0)

### 3 links have non-descriptive anchor text

3 0

About this issue: This issue is triggered if a non-descriptive anchor text is used for a link (either internal or external). An anchor is considered to be non-descriptive if it doesn't give any idea of what the linked-to page is about, for example, "click here", "right here", etc. This type of anchor provides little value to users and search engines as it doesn't provide any information about the target page.

Also, such anchors will offer little in terms of the target page's ability to be indexed by search engines, and as a result, rank for relevant search requests. For more information on the criteria used to trigger this check, refer to kb article title. How to fix: To let users and search engines understand the meaning of the linked-to page, use a succinct anchor text that describes the page's content.

For best practices on how to optimize your anchor text, refer to the "Write good link text" section in Google's Search Engine Optimization (SEO) Starter Guide [https://support.google.com/webmasters/answer/7451184?hl=en&ref\\_topic=9460495&authuser=0](https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0).

### 2 subdomains don't support HSTS

2 0

### 1 page needs more than 3 clicks to be reached

1 0

About this issue: A page's crawl depth is the number of clicks required for users and search engine crawlers to reach it via its corresponding homepage. From an SEO perspective, an excessive crawl depth may pose a great threat to your optimization efforts, as both crawlers and users are less likely to reach deep pages. For this reason, pages that contain important content should be no more than 3 clicks away from your homepage.

How to fix: Make sure that pages with important content can be reached within a few clicks. If any of them are buried too deep in your site, consider changing your internal link architecture.

0 page URLs are longer than 200 characters

0 0

Robots.txt not found

0 0

## 4xx errors

**i** About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1. DDoS protection system. 2. Overloaded or misconfigured server. How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1. Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt

## Historical chart for audits

## Broken internal links

**i** About this issue: Broken internal links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Broken internal links 92

## Duplicate title tags

**i** About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned. Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: <https://support.google.com/webmasters/answer/35624>

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Duplicate title tags 78

## Duplicate content

**i** *About this issue: Webpages are considered duplicates if their content is 85% identical. Having duplicate content may significantly affect your SEO performance. First of all, Google will typically show only one duplicate page, filtering other instances out of its index and search results, and this page may not be the one you want to rank. In some cases, search engines may consider duplicate pages as an attempt to manipulate search engine rankings and, as a result, your website may be downgraded or even banned from search results. Moreover, duplicate pages may dilute your link profile. How to fix. Here are a few ways to fix duplicate content issues: 1. Add a rel="canonical" link to one of your duplicate pages to inform search engines which page to show in search results. 2. Use a 301 redirect from a duplicate page to the original one. 3. Use a rel="next" and a rel="prev" link attribute to fix pagination duplicates. 4. Instruct GoogleBot to handle URL parameters differently using Google Search Console. 5. Provide some unique content on the webpage. For more information, please read these articles: <https://support.google.com/webmasters/answer/66359?hl=en> and <https://support.google.com/webmasters/answer/139066?hl=en>*

## Issues with mixed content

- i **About this issue:** If your website contains any elements that are not secured with HTTPS, this may lead to security issues. Moreover, browsers will warn users about loading unsecure content, and this may negatively affect user experience and reduce their confidence in your website. How to fix: Only embed HTTPS content on HTTPS pages. Replace all HTTP links with the new HTTPS versions. If there are any external links leading to a page that has no HTTPS version, remove those links.

**Slow page (HTML) load speed**

**i** About this issue: Page (HTML) load speed is one of the most important ranking factors. The quicker your page loads, the higher the rankings it can receive. Moreover, fast-loading pages positively affect user experience and may increase your conversion rates. Please note that "page load speed" usually refers to the amount of time it takes for a webpage to be fully rendered by a browser. However, crawler only measures the time it takes to load a webpage's HTML code - load times for images, JavaScript and CSS are not factored in. How to fix: The main factors that negatively affect your HTML page generation time are your server's performance and the density of your webpage's HTML code. So, try to clean up your webpage's HTML code. If the problem is with your web server, you should think about moving to a better hosting service with more resources.

**Historical chart for audits**

## Uncompressed JavaScript and CSS files

**i** About this issue: This issue is triggered if compression is not enabled in the HTTP response. Compressing JavaScript and CSS files significantly reduces their size as well as the overall size of your webpage, thus improving your page load time. Uncompressed JavaScript and CSS files make your page load slower, which negatively affects user experience and may worsen your search engine rankings. If your webpage uses uncompressed CSS and JS files that are hosted on an external site, you should make sure they do not affect your page's load time. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Enable compression for your JavaScript and CSS files on your server. If your webpage uses uncompressed CSS and JS files that are hosted on an external site, contact the website owner and ask them to enable compression on their server. If this issue doesn't affect your page load time, simply ignore it.

### Uncached JavaScript and CSS files

*About this issue: This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time. And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: If JavaScript and CSS files are hosted on your website, enable browser caching for them. If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.*

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

### Uncached JavaScript and CSS files 100

## Unminified JavaScript and CSS files

*About this issue: Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.*

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Unminified JavaScript and CSS files 100

## Nofollow attributes in outgoing internal links

**i** About this issue: The rel="nofollow" attribute is an element in an <a> tag that tells crawlers not to follow the link (e.g., "<a href='\"http://example.com/link\" rel='\"nofollow\">Nofollow link example</a>"). \"Nofollow\" links don't pass any link juice to referred webpages. That's why it is not recommended that you use nofollow attributes in internal links. You should let link juice flow freely throughout your website. Moreover, unintentional use of nofollow attributes may result in your webpage being ignored by search engine crawlers even if it contains a valuable content. How to fix: Make sure not to use nofollow attributes by mistake. Remove them from <a> tags, if necessary.

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Nofollow attributes in outgoing internal links 100

**i** We're only displaying 100 results. To view all results, export your report to a CSV or Excel file format.

## Too large JavaScript and CSS total size

**i** About this issue: This issue is triggered if the total transfer size of the JavaScript and CSS files used on your page exceeds 2 MB. The size of the JavaScript and CSS files used on a webpage is one of the important factors for a page's load time. Having lots of clunky JavaScript and CSS files make your webpage "heavier" in weight, thus increasing its load time. This in turn leads to a poor user experience and lower search engine rankings. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Review your pages to make sure that they only contain necessary JavaScript and CSS files. If all resources are important for your page, consider reducing their transfer size.

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Too large JavaScript and CSS total size 100

### Too many JavaScript and CSS files

*About this issue: This issue is triggered if a webpage uses more than a hundred JavaScript and CSS files. Each time a visitor navigates to a webpage, their browser first starts loading supportive files, such as JavaScript and CSS. For each file used by your webpage, a browser will send a separate HTTP request. Each request increases your page load time and affects its rendering, which has a direct impact on user experience, bounce rate and, ultimately, search engine rankings. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Review your pages to make sure that they only contain necessary JavaScript and CSS files. If all resources are important for your page, we recommend that you combine them.*

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

**i** We're only displaying 100 results. To view all results, export your report to a CSV or Excel file format.

## Missing meta description

**i** About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users. For more information, please see these article: [Create good titles and snippets in Search Results: https://support.google.com/webmasters/answer/35624](https://support.google.com/webmasters/answer/35624). How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

● Missing meta description

**i** We're only displaying 100 results. To view all results, export your report to a CSV or Excel file format.

### Low text to HTML ratio

**i** About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

### Low text to HTML ratio 100

## Missing ALT attributes

**i** About this issue: Alt attributes within `<img>` tags are used by search engines to understand the contents of your images. If you neglect alt attributes, you may miss the chance to get a better placement in search results because alt attributes allow you to rank in image search results. Not using alt attributes also negatively affects the experience of visually impaired users and those who have disabled images in their browsers. For more information, please see these articles: *Using ALT attributes smartly*: <https://webmasters.googleblog.com/2007/12/using-alt-attributes-smartly.html> and *Google Image Publishing Guidelines*: <https://support.google.com/webmasters/answer/114016?hl=en>. How to fix: Specify a relevant alternative attribute inside an `<img>` tag for each image on your website, e.g., "`<img src='mylogo.png' alt='This is my company logo'>`".

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Missing ALT attributes 100

### Broken external images

*About this issue: A broken external image is an image that can't be displayed because it no longer exists or because its URL is misspelled. Having too many broken external images negatively affects user experience and may be a signal to search engines that your website is poorly coded or maintained. How to fix: To fix a broken external image, perform one of the following: 1. If an image was deleted or damaged, replace it with a new one. 2. If an image is no longer needed, simply remove it from your page's code. 3. If an image moved to a different location and you know its new address, change its URL*

## Missing h1

**i** About this issue: While less important than <title> tags, h1 headings still help define your page’s topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page’s heading hierarchy, which is not SEO friendly. How to fix: Provide a concise, relevant h1 heading for each of your page.

## Broken external links

**i** About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

## Resources formatted as page links

**i** About this issue: We detected that some links to resources are formatted with `<a href>` HTML element. An `<a>` tag with a href attribute is used to link to other webpages and must only contain a page URL. Search engines will crawl your site from page to page by following these HTML page links. When following a page link that contains a resource, for example, an image, the returned page will not contain anything except an image. This may confuse search engines and will indicate that your site has poor architecture. How to fix: Review your links. Replace `<a href>` links with tags necessary for specific resources. For example, if you'd like to add an image, use an `<img>` tag with an alt attribute describing the contents of your image.

**i** We're only displaying 100 results. To view all results, export your report to a CSV or Excel file format.

## Pages with only one internal link

**i** About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them. How to fix: Add more incoming internal links to pages with important content.

## Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Pages with only one internal link 71

## Orphaned sitemap pages

**i** About this issue: An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget. If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally. How to fix: Review all orphaned pages in your sitemap.xml files and do either of the following: If a page is no longer needed, remove it; If a page has valuable content and brings traffic to your website, link to it from another page on your website; If a page serves a specific need and requires no internal linking, leave it as is.

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## Orphaned sitemap pages 47

## Permanent redirects

- i **About this issue:** Although using permanent redirects (a 301 or 308 redirect) is appropriate in many situations (for example, when you move a website to a new domain, redirect users from a deleted page to a new one, or handle duplicate content issues), we recommend that you keep them to a reasonable minimum. Every time you redirect one of your website's pages, it decreases your crawl budget, which may run out before search engines can crawl the page you want to be indexed. Moreover, too many permanent redirects can be confusing to users. **How to fix:** Review all URLs with a permanent redirect. Change permanent redirects to a target page URL where possible.

## External pages or resources with 403 HTTP status code

**i** *About this issue: This issue is triggered if a crawler gets a 403 code when trying to access an external webpage or resource via a link on your site. A 403 HTTP status code is returned if a user is not allowed to access the resource for some reason. In the case of crawlers, this usually means that a crawler is being blocked from accessing content at the server level. How to fix: Check that the page is available to browsers and search engines. To do this, follow a link in your browser and check the Google Search Console data. 1. If a page or resource is not available, contact the owner of the external website to restore deleted content or change the link on your page. 2. If a page is available but our bot is blocked from accessing it, you can ask the external website owner to unblock the page, so we can check all resources correctly. You can also hide this issue from your list.*

## Nofollow attributes in outgoing external links

- i **About this issue:** A nofollow attribute is an element in an `<a>` tag that tells crawlers not to follow the link. "Nofollow" links don't pass any link juice or anchor texts to referred webpages. The unintentional use of nofollow attributes may have a negative impact on the crawling process and your rankings. How to fix: Make sure you haven't used nofollow attributes by mistake. Remove them from `<a>` tags, if needed.

**Historical chart for audits**

**Links with no anchor text**

**i** *About this issue: This issue is triggered if a link (either external or internal) on your website has an empty or naked anchor (i.e., anchor that uses a raw URL), or anchor text only contains symbols. Although a missing anchor doesn't prevent users and crawlers from following a link, it makes it difficult to understand what the page you're linking to is about. Also, Google considers anchor text when indexing a page. So, a missing anchor represents a lost opportunity to optimize the performance of the linked-to page in search results. How to fix: Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about. Also, use short but descriptive text. For more information, please see the "Use link wisely" section in Google's SEO Starter Guide [https://support.google.com/webmasters/answer/7451184?hl=en&ref\\_topic=9460495&authuser=0](https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0)*

### Links with non-descriptive anchor text

**i** About this issue: This issue is triggered if a non-descriptive anchor text is used for a link (either internal or external). An anchor is considered to be non-descriptive if it doesn't give any idea of what the linked-to page is about, for example, "click here", "right here", etc. This type of anchor provides little value to users and search engines as it doesn't provide any information about the target page. Also, such anchors will offer little in terms of the target page's ability to be indexed by search engines, and as a result, rank for relevant search requests. For more information on the criteria used to trigger this check, refer to kb article title. How to fix: To let users and search engines understand the meaning of the linked-to page, use a succinct anchor text that describes the page's content. For best practices on how to optimize your anchor text, refer to the "Write good link text" section in Google's Search Engine Optimization (SEO) Starter Guide [https://support.google.com/webmasters/answer/7451184?hl=en&ref\\_topic=9460495&authuser=0](https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0).

## No HSTS support

**i** About this issue: HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support. How to fix: Use a server that supports HSTS.

### Historical chart for audits

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

## No HSTS support 2

## Page Crawl Depth more than 3 clicks

**i** About this issue: A page's crawl depth is the number of clicks required for users and search engine crawlers to reach it via its corresponding homepage. From an SEO perspective, an excessive crawl depth may pose a great threat to your optimization efforts, as both crawlers and users are less likely to reach deep pages. For this reason, pages that contain important content should be no more than 3 clicks away from your homepage. How to fix: Make sure that pages with important content can be reached within a few clicks. If any of them are buried too deep in your site, consider changing your internal link architecture.

**Historical chart for audits**

Period: October 26, 2024 (10:08) - October 26, 2024 (10:08)

**Page Crawl Depth more than 3 clicks 1**
