# **Equestrian Jump Game - Game Design Document**

# **Game Overview**

A casual pixel art equestrian jumping game where players control a horse and rider through progressively challenging show jumping courses. The goal is to complete as many jumps as possible within a time limit, advancing through increasingly difficult levels.

# **Core Gameplay Loop**

- 1. Player selects an avatar
- 2. Player attempts to clear jumps using timing-based mechanic
- 3. Successfully cleared jumps earn points and progress
- 4. Complete enough jumps within time limit to advance to next level
- 5. Difficulty increases with each level
- 6. Game ends when player fails to complete a level
- 7. Final score based on levels completed and total points

# **Game Mechanics**

#### **Avatar Selection**

#### **5 Character Options:**

- Girl with brown hair and horse ears (default)
- Girl with blonde hair and horse ears
- Brown-skinned girl with black hair and horse ears
- Golden-skinned girl (Asian) with black hair and horse ears
- White boy with brown hair and horse ears

#### Implementation:

- Character selection screen on game start
- Selected avatar persists through gameplay session

Avatar is displayed on horse during jumping sequences

# **Jumping Mechanic (Core Gameplay)**

#### Visual Interface:

- Vertical timing meter displayed on right side of screen
- Meter contains three zones from top to bottom:
  - Early Zone (Red/Gray)
  - o Perfect Zone (Green) target area
  - Late Zone (Red/Gray)
- Moving indicator travels vertically up and down the meter
- Speed of indicator movement increases with each level

# **Player Input:**

- Single tap/click to attempt jump when indicator is in position
- No button holding or multi-button combinations

#### **Outcome States:**

#### 1. Too Late (After Green Zone)

- Horse stops short of jump
- Horse backs up 2-3 steps
- Time continues running
- Horse automatically attempts same jump again
- Player feedback "Oops! Jump again"
- Points awarded (see scoring section)

## 2. Perfect (Green Zone)

- Horse successfully clears jump
- Points awarded (see scoring section)
- Horse continues to next jump
- Visual/audio success feedback
- Player feedback "Perfect!"

## 3. Too Early (Before Green Zone)

- Horse knocks rail off jump
- Horse slows down for 2-3 steps
- Minor point penalty or no points for that jump
- Time continues running
- Horse automatically continues to next jump

- Player feedback "Keep Going!"
- Points awarded (see scoring section)

# **Level Structure**

**Level Objective:** Complete X jumps within Y seconds (values scale per level)

# Level 1 Starting Values (Suggested):

Time Limit: 60 secondsRequired Jumps: 10 jumps

• Meter Speed: Baseline (e.g., 2 seconds per full cycle)

# **Progression Per Level:**

- Time limit may decrease by 5 seconds OR stay constant
- Required jumps increase by 2-3 per level
- Meter speed increases by 10-15% per level
- Jump visual variety can increase (aesthetic only)

#### **Level Completion:**

- Player must complete required number of jumps before time runs out
- Successfully completing a level unlocks the next level
- Player proceeds immediately to next level after completion

#### Level Failure:

- Time runs out before required jumps are completed
- Game ends
- Player sees final score screen

# **Scoring System**

## **Points Awarded:**

Perfect Jump (green zone): 100 points
Image with Fault (late timing): 50 points

• Jump with Fault (late timing): 50 points

#### **Score Multipliers (Optional Enhancement):**

- Consecutive perfect jumps: +10% per consecutive perfect (max 50% bonus)
- Reset on failed attempt

## **High Score Tracking:**

- Primary metric: Highest level reached
- Secondary metric: Total points accumulated
- Both displayed on game over screen

# **Display During Gameplay:**

- Time remaining: Countdown
- Jumps Cleared: Number of successful jumps in current level
- Rails Down: Number of knocked rails in current level
- Current Score: Total points accumulated

# **User Authentication & Save System**

# Login System:

- Email-based authentication (no password required for MVP)
- Email serves as unique user identifier
- Magic link or simple code verification recommended

#### Saved Data Per User:

- Highest level reached
- High score (points)
- Selected avatar preference
- Total games played (optional)
- Total jumps cleared (optional)

#### **Data Persistence:**

- Saved to backend database
- Retrieved on login
- Updated at end of each game session

# Visual & Audio Design

# **Art Style**

- Pixel art aesthetic
- Bright, cheerful color palette
- Equestrian/countryside theme

Clear visual feedback for all game states

# **Required Visual Elements**

- 5 avatar character sprites in various skin tones, all in the red jacket riding outfit. Same model, just different coloring
- 3 horse sprites with animation frames (idle, running, jumping) Same model, in colors grey, black, and med brown with black mane/tail, all with various white markings
- Jump obstacles (multiple variations for visual variety)
- Background arena/course environment
- UI elements (timer, meters, score display)
- Timing meter with colored zones

# Audio (I will source and provide for integrating into game)

- Background music (calm, upbeat)
- Jump success sound
- Jump fault sound (rail knock)
- Failed attempt sound (horse stopping)
- Level complete fanfare
- Game over sound

# **Technical Requirements**

#### **Platform**

- HTML5 Canvas for rendering
- JavaScript for game logic
- Responsive design for desktop and mobile

#### **Controls**

- Mouse click (desktop)
- Touch tap (mobile)
- Single input method for jumping

# **Performance Targets**

- 60 FPS gameplay
- Responsive input (<50ms delay)</li>
- Fast load times (<3 seconds)

# **Browser Compatibility**

- Modern browsers (Chrome, Firefox, Safari, Edge)
- Mobile browsers (iOS Safari, Chrome Mobile)

# **Game Flow**

## 1. Start Screen

- Game title/logo
- "Start Game" button
- "How to Play" button (optional tutorial)

# 2. Login Screen

- Email input field
- "Continue" button
- Display returning player's high score if applicable

## 3. Avatar Selection

- Display 5 avatar options → Click to select
- Display 3 horse options → Click to select
- "Start Riding" button

# 4. Game Screen

- Arena background
- Horse and rider in center/left
- Jumps approaching from right
- Timing meter on right side
- HUD displaying: Time, Clears, Faults, Score

## 5. Level Transition

- Brief "Level Complete!" message
- Display level number
- Show current score
- Auto-proceed to next level after 2 seconds

#### 6. Game Over Screen

- "Game Over" message
- Final level reached
- Final score
- "Play Again" button
- High score comparison (if improved)

# **MVP Feature Priority**

# **Must Have (Phase 1)**

- Avatar selection (5 characters), horse selection (3 characters)
- Jumping timing mechanic with meter
- Three outcome states (early/perfect/late)
- Level progression with increasing difficulty
- Score tracking
- Email login and save system
- Basic pixel art graphics
- Sound effects and music
- Animations (horse running, jumping, reacting)
- Score multipliers
- Tutorial/How to Play screen
- Leaderboards (compare with other players)

# **Future Enhancements (Phase 2)**

- Multiple horse breeds
- Customization options (outfit colors, accessories)
- Different arena environments
- Power-ups or special abilities
- Multiplayer races or competitions
- Achievement system

# **Success Metrics**

## **Player Engagement:**

- Average session length
- Return player rate
- Average level reached

# **Difficulty Balance:**

- Level 1 completion rate (target: 90%+)
- Level 5 completion rate (target: 50%)
- Level 10 completion rate (target: 10-20%)

#### **Technical Performance:**

- Frame rate stability (target: consistent 60 FPS)
- Input responsiveness (target: <50ms)
- Load time (target: <3 seconds)</li>

# **Development Notes for Engineer**

# **Timing Meter Implementation**

- Meter should use easing function for smooth movement
- Green zone should be consistent pixel height per level
- Consider tweening library for smooth animation
- Ensure input detection is frame-perfect

# **Difficulty Scaling**

- Use configurable JSON for level parameters
- Allow easy tweaking of timing windows
- Implement progressive difficulty curve formula

# **State Management**

- Implement clear game states (menu, playing, paused, game over)
- Handle transitions cleanly
- Ensure proper cleanup between game sessions

## **Mobile Considerations**

- Larger tap target for timing meter
- Touch-friendly UI elements
- Test on various screen sizes
- Optimize asset loading for mobile networks

# **Estimated Development Timeline**

- Week 1: Core game loop, jumping mechanic, basic visuals
- Week 2: Level progression, difficulty scaling, UI/HUD
- **Week 3:** Avatar system, login/save system, polish**Week 4:** Testing, bug fixes, performance optimization
